

Powered Roller & Misc Powered Conveyors Photo Gallery

Powered Split Roller Conveyor

This split roller conveyor was equipped with white UHMW rollers on 4" centers to convey finished products from a robot. With two pop-up blade stops and a product lift & push this conveyor was fully equipped to be a plug and play option. All the stops and pushers were pneumatically controlled and the conveyor was chain driven.

Cable Reel Conveyor

This conveyor is designed to power-assist the unreeling of large cable spools.

Power Roller Incline

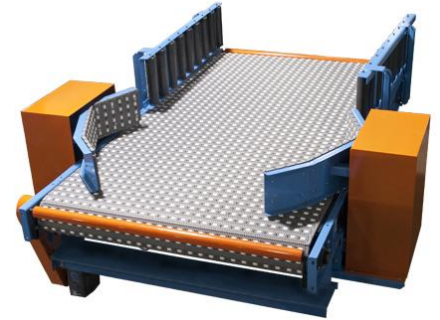

The inclusion of a specially formed polyurethane band allows this powered roller conveyor to move products up an incline.

Puller Dog Lumber Transfer

Designed for the lumber industry, the Puller Dog Lumber Transfer is built to accept fresh cut boards of various lengths as they discharge from a high-speed saw. The Puller Dogs on the chains then transfer the boards off to either side onto gravity accumulation conveyors. *Guards removed for presentation clarity.

Tire Centering Device

The tire centering device will align tires in the center of the conveyor to be unloaded by robot. As tires move into the centering area the paddles clamp onto the tire placing it in the center. The 52" wide series 400 roller top belt allows the conveyor to operate continuously while the tire is clamped in place. Roller top belt has also been attached to the face of the paddles to aid in alignment.
